Your project repository

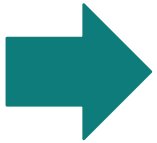

GitHub + Posit Cloud · Part 1 (live, 30 minutes)

CIS-3901 Data Visualization and Presentation · Module 10 · Thursday, Oct 22, 2026

Handout: Module 10 Setup, Part 1 (printed and in Blackboard)

Start with the cake: you've seen this site

The example from Module 9
`acintron-cc.github.io/cis-3901-202710`
A report and slides about penguins, published from a GitHub repository.

Yours, by the end of today
`YOUR-USERNAME.github.io/cis-3901-projects`
Same site, your address. In December it holds your own reports and slides.

Today you copy the whole project, turn its website on, and open it where you work.

Today: three steps, then the Tidy Data drafts

1

Copy the template
on GitHub
about 8 min

2

Turn on your website
on GitHub
about 5 min

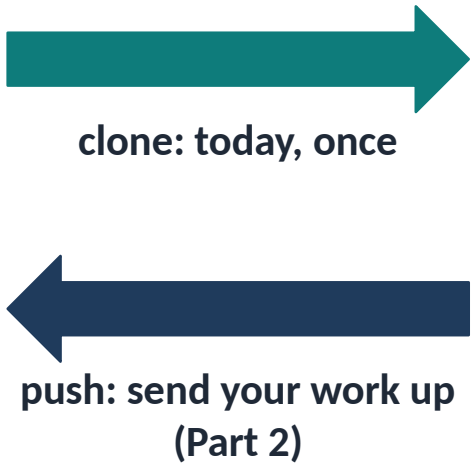

3

Open it in Posit Cloud
on Posit Cloud
about 10 min

Part 2 is a self-paced tutorial (Blackboard): tell Git who you are, create a token, make your first commit and push, and publish your own site. About 45 minutes, on your own time.

Two places, one project

GitHub repository
The shared copy of your project. Public. It powers your website.

Posit Cloud project
Your working copy. Where you write R and render reports.

Pull brings changes back down (Part 2). The website shows what is on GitHub, not what is in Posit Cloud.

Four words for today

Repository (repo)
A project folder that Git tracks, with its full history of changes.

Template
A repository made for copying. Your copy starts with its files, then is yours alone.

Clone
Make a working copy of a repository somewhere else, here in Posit Cloud.

GitHub Pages
GitHub's free website hosting. It serves your docs/ folder at your own address.

Step 1 · Copy the template

1

Open the template link in Blackboard (signed in to GitHub), then:

Use this template › **Create a new repository**

Field	Choose
Owner	your username
Repository name	`cis-3901-projects`
Visibility	Public
Include all branches	leave unchecked

Then click Create repository.

Check

The address bar shows `github.com/YOUR-USERNAME/ cis-3901-projects` and the name says Public.

Step 2 · Turn on your website

2 In your new repository (not the template):

Settings › **Pages** › **Deploy from a branch** › **main** › **/docs** › **Save**

Your site's address

`https://YOUR-USERNAME.github.io/cis-3901-projects/`

It takes 1 to 3 minutes to appear. Don't wait: go on to Step 3 and check it at the end.

Step 3 · Open it in Posit Cloud

3

a. On GitHub, copy your repository's web address

Code (green) › HTTPS › Copy

b. On Posit Cloud

CIS-3901-Fall2026 › New Project › New Project from Git Repository › Paste · OK

Paste the address of YOUR repository, the one with your username in it:
`https://github.com/YOUR-USERNAME/cis-3901-projects.git`

Checkpoint: show your neighbor

GitHub
Your repository, under your username, marked Public.

Website
Settings › Pages says your site is live. Open it: the course site, at your address.

Posit Cloud
Files pane shows _quarto.yml, data, docs, reports… and a Git tab appears at the top right.

Missing one? Raise your hand, or finish it from the handout after class. Write down both links: your repository and your site.

Part 2, on your own: the online tutorial

A
Tell Git who you are

B
Create a token

C
First commit and push

D
Render and publish

`acintron-cc.github.io/cis-3901-202710-guides`
Module 10 › Setup, Part 2. About 45 minutes, no Git experience needed. Finish before the Fairness Data project starts (date in Blackboard).

A token works like a password. Never put it in a file, a commit, a chat, an email, or an AI tool.

Before you leave

- Write down your repository link and your site link.
- Tidy Data stays in the challenge-tidy-data project. Post Done in Blackboard when you finish (due Sat, Oct 24).
- Part 2 tutorial: acintron-cc.github.io/cis-3901-202710-guides (Module 10), before the Fairness Data project starts.
